

ABSTRACT

This invention is related to new oral pharmaceutical dosage forms comprising a proton pump inhibitor, i.e. a H^+ , K^+ -ATPase inhibitor, a gastric antisecretory prostaglandin

analogue compound, and optionally an additional drug such as a calcium channel blocking agent, especially for use in the treatment and prophylaxis of gastrointestinal disorders.

More specifically the invention is related to new dosage forms comprising omeprazole and misoprostol. The invention is also related to a combination of the three categories of drugs, i.e. the H^+ , K^+ -ATPase inhibitor, the gastric antisecretory prostaglandin analogue, and the

calcium channel blocking agent. Furthermore, the invention refers to a method for the manufacture of the described dosage forms and their use in medicine, as well as blister packs comprising these medicaments.
